研究成果簡述：

The major researches in my lab:

1. **流感病毒**: Avian Influenza viruses (AIVs) cause severe diseases in poultry worldwide. We aimed to investigate the impact of the viral NS1 protein on viral infection dynamics. By exchange of the NS segment, the replication of reassortant AIVs was significantly affected and that reflected the modulatory effect of NS1 on host anti-viral responses and viral RdRp activity. These results indicate that NS1 is a critical factor responsible for the diverse traits of AIVs in Taiwan.
2. **羊 orf 病毒**: Orf virus (ORFV), a parapoxvirus, causes endemic disease in goats. Since 2007, we initiated the ORFV studies, not only in molecular epidemiology but also in the pathogenesis aspect. In particular, we revealed the function and mechanism of OV20.0 protein on counteracting innate immune response and suppresses RNA interference machinery. Extending from the understanding of its distinct immune regulatory effect, we are currently exploring the oncolytic activity of ORFV in several cancer models.
